Nothing dates like a prediction. From our vantage point two centuries later, these imaginary scenarios of the technological future look ridiculous. They were, of course, intended to be funny, yet they also hovered on the brink of possibility. Based on contemporary proposals, some of them remained for ever shrouded in clouds of fantasy, while others subsequently developed to become part of everyday normality.

Far from celebrating the success of scientific innovations, this colourful collage provides a graphic warning about the dangers of change over time: ‘Lord how this world improves as we grow older,’ proclaims the ironic title. Progress became a buzzword during the Victorian era, but diehards continued to voice longstanding complaints that the world had been going downhill since the time of the Greeks. Moralising reactionaries preached that although modern inventions might make life easier, the nation risked sinking into a sinfully luxurious lifestyle.

Around 1830, several ‘March of Intellect’ caricatures appeared, prompted by the reduction in publishing costs made possible by steam technology and cheaper paper. Opponents of innovation protested that too many books and journals were pouring off the newly mechanised presses: in their eyes, steam power was not only introducing dangerously fast trains, but was also threatening to destroy society by taking knowledge to the masses.

At the bottom right of this print, a young man is reading his cheap steam-printed newspaper, his menial job taken over by the Royal Patent Boot Cleaning Engine. Was it right that a common labourer should study at leisure instead of working twelve hours a day? When books had been expensive, only the upper classes could afford them – and what was wrong with that? If knowledge spread, perhaps the working classes would gain...
sufficient power to overthrow the traditional system based on privileged birth.

These dire prognostications are reinforced by the vignette prominently placed at the centre front. As if it were her natural right, an elegant young woman sits reading a sentimental story, delicately eating sliced pineapple beneath a parasol held aloft by her little black servant. Both the food and the boy are emblems of wealth and colonial domination. Pineapples were luxury items, often prominently displayed on aristocratic dining tables without being eaten. But here, a scruffy labourer is greedily consuming an entire fruit, while his slovenly friend enquires ‘Vont you take a hice Joe?’ – ice cream being another expensive treat still reserved for the rich.

Above this scene of social upheaval, passengers on Greenwich Hill are scrambling to climb aboard a metal cylinder for the next direct trip to Bengal operated by the GRAND VACUUM TUBE COMPANY. At its other end, a passenger has just disembarked to shake an Indian’s hand in front of some misplaced palm trees. Behind them is ‘The Company’s Suspension Bridge’, supposedly stretching to Cape Town and probably a reference to the competition for spanning the Clifton Gorge near Bristol. In real life, the engineer George Medhurst had already proposed using air-propelling cylinders for trains. After they were installed in Dublin, Croydon and Devon, passengers loved the smooth ride, free from the smell of sulphur and the irritation of coke dust. If only Victorians had thought more about the future of their planet and less about money: this low-pollution travel was rejected as less profitable than dirty steam engines.

At the time, it was impossible to be sure which innovations would endure. To the right of the pineapple stall, Heath shows ‘The Steam Horse VELOCITY’ trundling along on a wheeled platform, smoke pouring from its nostrils. Fifteen years earlier, several collieries had introduced Steam Horse locomotives pushed by mechanical feet plodding along the ground behind. They had soon been abandoned, but here seem no more bizarre than the watering can just behind Greenwich Hill. Its mocking tag – ‘McAdams newly Invented to lay the Dust he makes’ – reveals that nobody realised cheap road surfaces had arrived to stay.

This caricature is delightfully even-handed in its irreverence. Heath must have enjoyed devising its complexities, although the passage of time has made some of the jokes hard to decipher. The winged creature in the sky is flying to New South Wales, its convict passengers looking suitably scurrilous. A cloud of castles in the air is captioned ‘Scheme for the Payment of the National Debt’, while beneath them a cannon unleashes an explosion of ‘Irish Emigrants’. The triumphal arch on the left, now at Hyde Park Corner, was originally planned to celebrate the British victory over Napoleon, but by 1829, money had run out, and there was still no statue on top. Instead, this empty plinth bears a gibbet ‘Designed to Elevate the Architects.’ Next to it a church with Gothic windows and exotic decorations satirises the trend for increasingly ornate styles in British architecture, despite attempts to reinforce the power of Anglicanism.

Defying the gloomy prognoses, cheap books did not bring an end to civilisation. Today’s nostalgic technophobes forecast the opposite – that society will collapse when electronic media have eliminated printed books. But perhaps their pessimism will be proved similarly wrong.
